Adapting the feed, the animal and the feeding techniques to improve the efficiency and sustainability of monogastric livestock production systems

**Deliverable D7.1**

*Communication package (including website and brochure)*

Due date of deliverable: M4

Actual submission date: M5

**Start date of the project:** March 1st, 2015    **Duration:** 60 months

**Organisation name of lead contractor:** AFZ

**Revision:** V3

**Dissemination level**

1 Summary

The objectives of this deliverable are to create a communication package that includes both communication material (for the stakeholders) and communication tools (for the project partners).

The communication material includes a logotype symbolic of the project’s activities, a website that serves as a central hub for the dissemination of the project’s information and scientific results, a brochure and a poster presenting the project. The communication tool includes visual identity guidelines, an image pool to be used on the website and dissemination document and Powerpoint templates for presentations and posters. These elements will facilitate the dissemination of information and results by the partners.

The communication package was created by AFZ using this organisation’s skills in graphic design, website development and communication.

This deliverable was developed by AFZ with input from the project coordinator (INRA) and INRA Transfert. Members of the Executive Committee (INRA, Aarhus University, Wageningen University, Kaposvar University, University of Lleida, Newcastle University, AFZ) validated the website and the image pool. Several partners (INRA, Topigs, Aarhus University, Hamlet Protein, Cobb, AFZ) contributed to the image pool.

2 Introduction

The impact of the Feed-a-Gene project is heavily dependent on the ability of the project partners to disseminate information about the project to relevant stakeholders during the starting phase, and, at a later stage, to disseminate these results to the stakeholders. To achieve maximum impact, it is necessary:

1) to create a visual identity that federates all documents and assets created during the course of the Feed-a-Gene project
2) to create a platform that serves as the central hub for the dissemination of information and scientific results
3) to provide project partners with communication tools that will help them to disseminate information and results.

3 Results

3.1 Logotype

Feed-a-Gene is a multidisciplinary project that involves partners from three main areas of the livestock sector: feed production, animal production (monogastrics) and animal genetics. The logotype has to communicate the idea that the three domains are equally represented in the project and linked together. Despite this complexity, the logo must remain legible on all types of documents and devices, from large scientific posters to small smartphone screens.

The Feed-a-Gene logotype features the name of the project, written in a highly legible font, on top of three square boxes with rounded corners, each representing one domain.
• The left hand box symbolises the “feed” dimension. It features stylised outlines of a rapeseed flower and a clover leaf, which are two of the plant species studied in Feed-a-Gene.
• The central box represents the “animal production” dimension. It features stylised outlines of a pig, a chicken and a rabbit, the three livestock species targeted by the Feed-a-Gene project.
• The right hand box represents the “genetics” dimension. It features stylised DNA.

Some of the lines on each box continue on neighbouring box(es), as a reminder that all three domains are linked.

3.2 Visual identity guidelines

The keyword of Feed-a-Gene’s visual identity is simplicity allowing partners to produce high-quality documents using regular office software rather than desktop publishing tools.

3.2.1 Colours

3.2.2 Colour usage

3.2.2.1 General
Feed-a-Gene dissemination documents have a white background, black or dark grey body text and middle grey or coloured headers. The colours of the logotype (or colours derived from them by setting a transparency value) should be used for headers and other embellishments.

3.2.2.2 Logo
Title Middle grey; left box Green; central box Orange; right box Caribbean blue

3.2.2.3 Web
- Pages: background White; Header 1 Dark blue; Header 2 Caribbean Blue; body text Dark grey or black
- Blocks: background White; text and headers Dark blue
- Tabs: background Caribbean blue (passive), Light grey (active), Orange (hover); text White (passive/hover), or Dark grey (active)
- Bullets: Orange

3.2.3 Fonts

3.2.3.1 General
- Headers: Arial
- Text: Arial or Times New Roman

3.2.3.2 Logo
Arial Rounded MT Bold

3.2.3.3 Website
- Headers: Arial
- Text: Times New Roman

3.2.3.4 Powerpoint
- Headers and text: Arial
- Bullet shape: ▲ (Wingdings 2, code 187).

3.3 Image pool

As dissemination documents need to be attractive and illustrative, an image pool has been constituted from the contributions of Feed-a-Gene partners. At the time of writing, INRA, Topigs, Aarhus University, Hamlet Protein and Cobb have provided high quality, high resolution images for use on the website, on brochures and other dissemination documents, where the images appear with full credits. At the time of this writing, there are about 40 images in the image pool, which is likely to grow as the project advances. Before being used on dissemination documents, images are uploaded to the collaborative workspace to be validated by the ExCom.
3.4 Project website

Feed-a-gene’s website can be seen at www.feed-a-gene.eu. It has been created according to guidelines proposed by the European Commission\(^1\). It has been developed with Drupal, a popular, open-source and well-supported Content Management System. The website contains:

- A description of the project, of the overall plan and of the project governance
- A summary of each work package
- A map of the consortium with individual pages for each partner
- News
- An event calendar
- A media centre for the dissemination of all types of documents: brochures, factsheets, scientific papers, technical publications, presentations, posters etc.
- A contact form
- A registration form for stakeholders to register on the stakeholder platform and subscribe to the newsletter.

The following screenshots present several pages of the website.

\(^1\) http://ec.europa.eu/research/environment/pdf/project_website_guidelines_en.pdf
Feed-a-Gene – H2020 n°633531

Work plan
Feed-a-Gene is composed of six Research and Innovation work packages (WP), each of them including the demonstration of the technologies developed, one Dissemination WP and one Management WP. All WPs are linked to each other and results from some will be used by others. All WPs will operate from the start to the end of the project to take full advantage of the duration of the project. To facilitate the start of the project, some WPs will use existing data and models and will implement the results generated by the project at a later stage when they become available. This means that if one WP encounters a delay, the work planned in the rest of the project will not be compromised.

- WP1 will develop novel feeds, feed processing, and enzyme technologies to better use local resources including以免模型, green hens and by-products after the extraction of proteins from green hens. It will identify and quantify the impact of feed processing and enzyme technologies on the nutritional value of feeds. It will also develop new tools for routine analysis of chemical composition and nutritional values of feeds.
- WP2 will develop new animal traits to monitor feed efficiency, robustness and welfare in different species, and to identify individual diversity and variation over time. This will allow developing tools for the real-time control of animal status and for improved selection strategies. Strong interactions with WP1 will allow to better characterize digestibility and efficiency of different feeds.
- WP3 will model biological functions with emphasis on feed use mechanisms. It will develop mechanistic mathematical models of nutrient use during growth and reproduction. These models will then be used to predict variation in nutrient requirements over time and among individuals. Data on feed characteristics from WP1 and new traits developed in WP3 will be used in WP3.

Organisation
Feed-a-Gene gathers 23 partners from 8 European countries and China. 8 research institutes and higher education organisations, 9 industry partners (3 involved in livestock production, 2 in innovative technologies for animal housing, 3 in feed production and transformation, and 2 in equipment for precision feeding), 6 in extension and management.
The website is mobile-friendly and can be read on mobile devices such as smartphones (left panel) and tablets (right panel) both on vertical and horizontal modes.

The website uses Google Analytics to collect audience statistic that will be useful to assess the project’s impact. Because Google Analytics requires the use of cookies, the Feed-a-Gene website has been made compliant with the EC guidelines on privacy and data protection².

---
3.5 Project brochure

A project information brochure (A4 format, recto verso) was written in English. It includes basic information on the project and its partners, contact information and a call for stakeholders to register. The brochure can be downloaded in PDF from the website (http://www.feed-a-gene.eu/media/brochures).

Translations of the brochures to languages other than English are planned.

3.6 Feed-a-Gene poster

A poster (A0 format) was created. It is written in English and includes basic information on the project, its partners and stakeholders, and contact information. The poster can be downloaded in PDF format from the website (http://www.feed-a-gene.eu/media/posters).

3.7 Presentation and poster templates

- 2 Powerpoint templates for presentation (one in 4:3 ratio and the other in 16:9)
- 2 templates for scientific posters (A0 size, vertical with 1 or 2 columns). These templates can be downloaded from the collaborative workspace. Templates for other poster sizes will be made on demand. They have been designed with Powerpoint as this software is commonly used by all partners.

4 Conclusions

The communication package now allows to start the dissemination process. It contains a dissemination platform (the website), various dissemination tools (visual identity, templates), a brochure and a poster. These elements will facilitate the dissemination of information and results by the partners.

5 Annexes

- Brochure
- Poster
- Powerpoint templates for presentation
The Feed-a-Gene project

Feed-a-Gene aims to better adapt different components of monogastric livestock production systems (pigs, poultry and rabbits) to improve the overall efficiency of these systems, to reduce their environmental impact, and to enhance food security whilst maintaining food quality. Expected results include:

- **Alternative feeds and feed technologies** to make better use of local resources, green biomass and food and biofuel by-products.
- Methods for **real-time characterization** of the nutritional value of feeds.
- **New traits of feed efficiency and robustness** to select more adapted animals.
- **Models of livestock functioning** to better predict nutrient and energy utilization.
- **New management systems for precision feeding** and precision farming.
- Evaluation of the **sustainability** of those systems.

Those technologies will be demonstrated and disseminated in collaboration with industrial partners and farmers’ organisations.

**Feed-a-Gene at a glance**

- **9.9 M€** EC contribution
- **9.0 M€**
- **5 years**
- **March 2015 to February 2020**
- **23 partners** from 9 countries

**Feed-a-Gene**

The Feed-a-Gene project has received funding from the European Union’s H2020 Programme under grant agreement no 633531.
Feed-a-Gene is composed of 6 Research and Innovation work packages (WP), 1 Dissemination WP and 1 Management WP.

WP1 Alternative feed ingredients and real-time characterization
WP2 New traits for innovative feeding and breeding strategies
WP3 Modelling feed use and mechanisms
WP4 Management systems for precision feeding
WP5 Use of traits in animal selection
WP6 Sustainability assessment of the production system

Feed-a-Gene partners
Feed-a-Gene gathers 23 partners from 8 European countries and China: 8 research institutes and higher education organisations, 9 industry partners (2 involved in livestock production, 2 in innovative technologies for animal breeding, 3 in feed production and transformation, and 2 in equipment for precision feeding), 6 in extension and management.

21 Terres Inovia
22 AFZ
23 INRA Transfert

Feed-a-Gene stakeholders
Feed-a-Gene would like to involve all stakeholders of the animal production sector to take into account their needs and expectations:

- Farmers and cooperatives
- Genetics and breeding companies
- Producers of compound feeds, ingredients and additives
- Equipment manufacturers and IT solutions providers
- Food industry and retailers
- Extension services, technical advisors, consultants
- R&D organisations, academic institutions
- Networks and associations
- Consumer organisations
- Policy makers

All persons interested in the project results are invited to register on the website to subscribe to the newsletter. This will allow you to:

- be informed of the latest results, workshops and activities of the project as soon as they become available
- be invited to consultation events on specific issues for which the input from stakeholders is needed.

**Feed-a-Gene**

Feed-a-Gene is a EU-funded (H2020) research project that aims to better adapt different components of monogastric livestock production systems (pigs, poultry and rabbits) to improve the overall efficiency of these systems, to reduce their environmental impact, and to enhance food security whilst maintaining the quality of animal-derived food. Feed-a-Gene started in March 2015 for a duration of 5 years. It has a budget of 9.9 million €.

**Challenges and objectives**

Feed-a-Gene will provide answers to the new challenges facing animal production. In addition to productivity and efficiency, animal health and welfare, product quality and security, environmental impact, consumer and citizen expectations as well as competition between food, feed, and fuel have now become increasingly important. New solutions are thus required to increase the efficiency and sustainability of livestock production systems.

**Alternative feed sources and feed technologies**

The EU can rely on locally produced resources by unlocking the potential of existing feeds and identifying new and alternative feed sources. Because of the diversity in feed sources and technologies, an approach where different actors combine their skills and expertise is essential.

**Adapting animals and feeding techniques**

The efficiency of livestock production systems can be improved by better adapting the nutrient supply to animal requirements and by selecting animals adapted to use current or future feed sources. Monitoring devices allow precision livestock production, including precision feeding. Genetic diversity can be used to breed more efficient and robust animals. High-throughput technologies make it possible to pinpoint variability in traits from metabolites to gene sequence. Breeding schemes can be revisited to enhance selection efficiency. These technologies are essential tools to breed animals able to use feed resources that are not or less in competition with other uses.

**Work plan**

Feed-a-Gene is composed of 6 Research and innovation work packages (WP), 1 Dissemination WP and 1 Management WP.

1. **WP1 Alternative feed ingredients and real-time characterization**
2. **WP2 New traits for innovative feeding and breeding strategies**
3. **WP3 Modelling feed use and mechanisms**
4. **WP4 Management systems for precision feeding**
5. **WP5 Use of traits in animal selection**
6. **WP6 Sustainability assessment of the production system**

**Feed-a-Gene partners**

Feed-a-Gene gathers 23 partners from 8 European countries and China: 8 research institutes and higher education organisations, 9 industry partners (2 involved in livestock production, 2 in innovative technologies for animal breeding, 3 in feed production and transformation, and 2 in equipment for precision feeding), 6 in extension and management.

**Stakeholders**

Feed-a-Gene targets the following groups of stakeholders:

- Farmers and cooperatives
- Genetics and breeding companies
- Producers of compound feeds, ingredients and additives
- Equipment manufacturers and IT solutions providers
- Food industry and retailers

Stakeholders can register on the project website [www.feed-a-gene.eu](http://www.feed-a-gene.eu) to be informed of the project results and activities.

**Expected results**

- Alternative feeds and feed technologies to make better use of local resources, green biomass and food and biofuel by-products.
- Methods for real-time characterization of the nutritional value of feeds.
- New traits of feed efficiency and robustness to select more adapted animals.
- Models of livestock functioning to better predict nutrient and energy utilization.
- New management systems for precision feeding and precision farming.
- Evaluation of the sustainability of those systems.

The technologies developed by Feed-a-Gene partners will be demonstrated and disseminated in collaboration with industrial partners and farmers’ organizations.
